Bob Wisseman, Aquatic Biology Associates

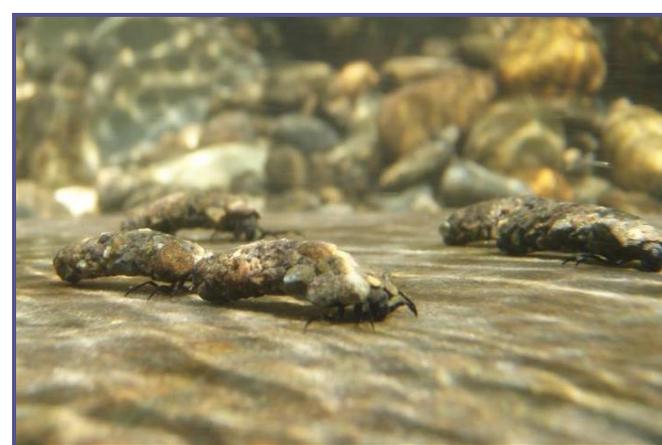

Funded by a US EPA
Scientific Studies and
Technical Investigation
Assistance Program Grant

Overview

- ✈ Updated Metric Attributes
- ✈ Puget Lowland B-IBI Recalibration
 - ✈ Rescore B-IBI from 10-50 to 0-100
 - ✈ Adjust for taxonomic effort
 - ✈ Assess natural features and collection area
- ✈ Evaluate Index Precision

Regional Benthic Monitoring Issues

Limitations	Desired Outcomes
Differing collection methods	Standardization/NBD
Decentralized data mgmt	Centralized data mgmt
Outdated taxa attributes	Peer-reviewed or Empirically derived attributes
Insufficient B-IBI sensitivity	Re-calibrated scoring
>20 cities, counties, tribes monitoring independently	Collaboration and communication

Goal: Improved decision making to restore and protect streams

Strengthen Sensitivity of Taxa Attributes

Puget Lowland B-IBI Metrics

Literature

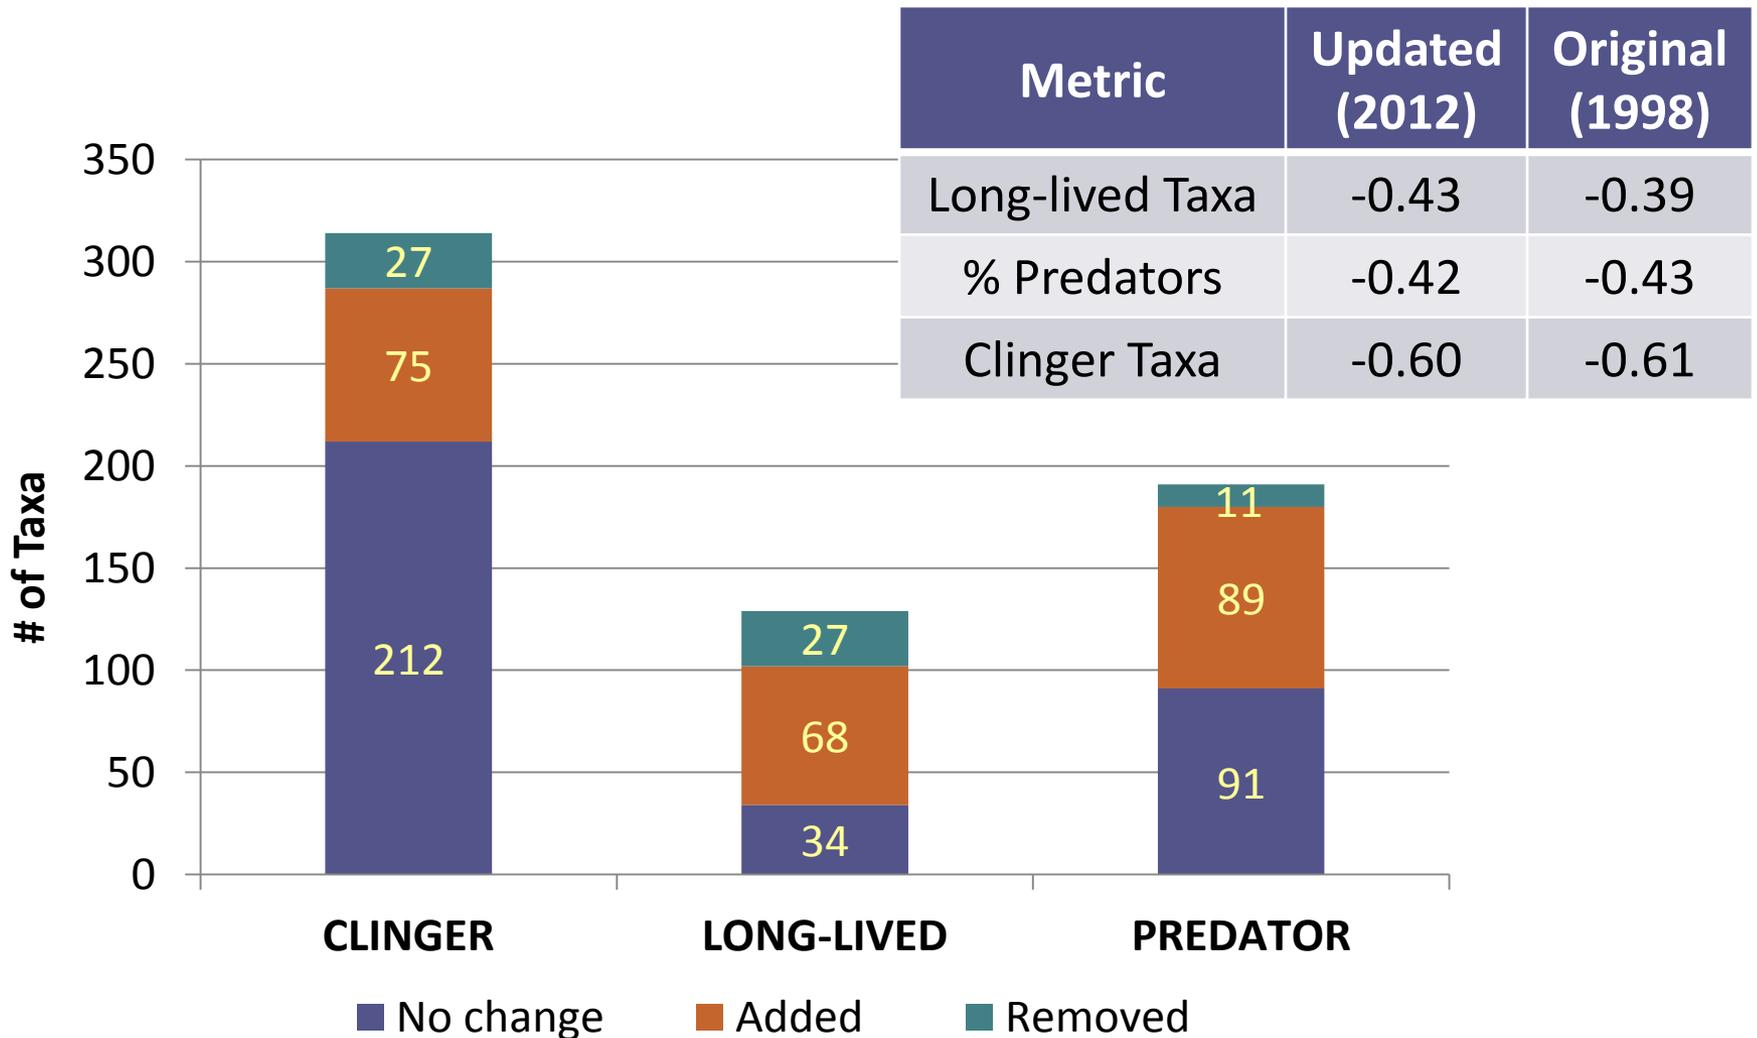

Update with
Existing Data

Published Literature Updates

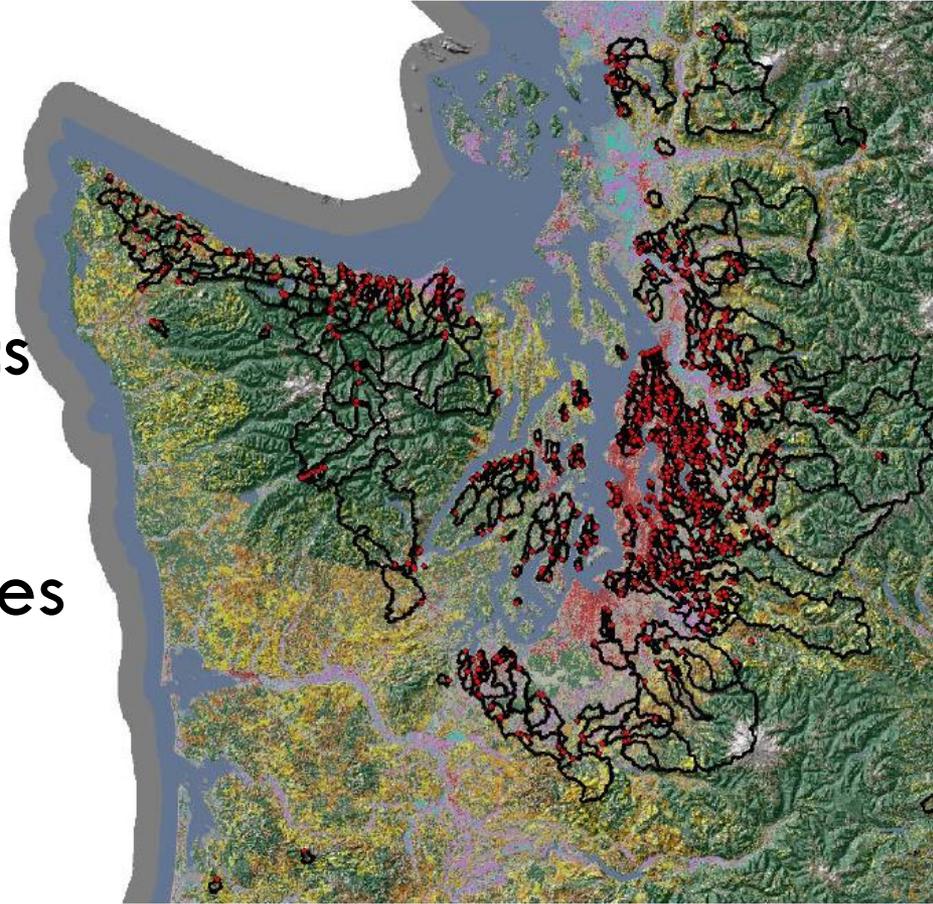

Attribute	Taxa Group	Primary Resources
Long-lived	stoneflies	Stewart and Stark 2002
	caddisflies	Wiggins 1996
	non-insects	Pennak 1989, Thorp and Covich 2001
	clams	Mackie 2007
	other mollusks	Dillon 2000
	other insect taxa	Hury et al. 2008, Poff et al. 2006
Predator	insects	Merritt et al. 2008
	non-insects	Pennak 1989, Thorp and Covich 2001
Clinger	insects	Merritt et al. 2008
	non-insects	not applicable

Attribute Changes: 1998 vs. 2012

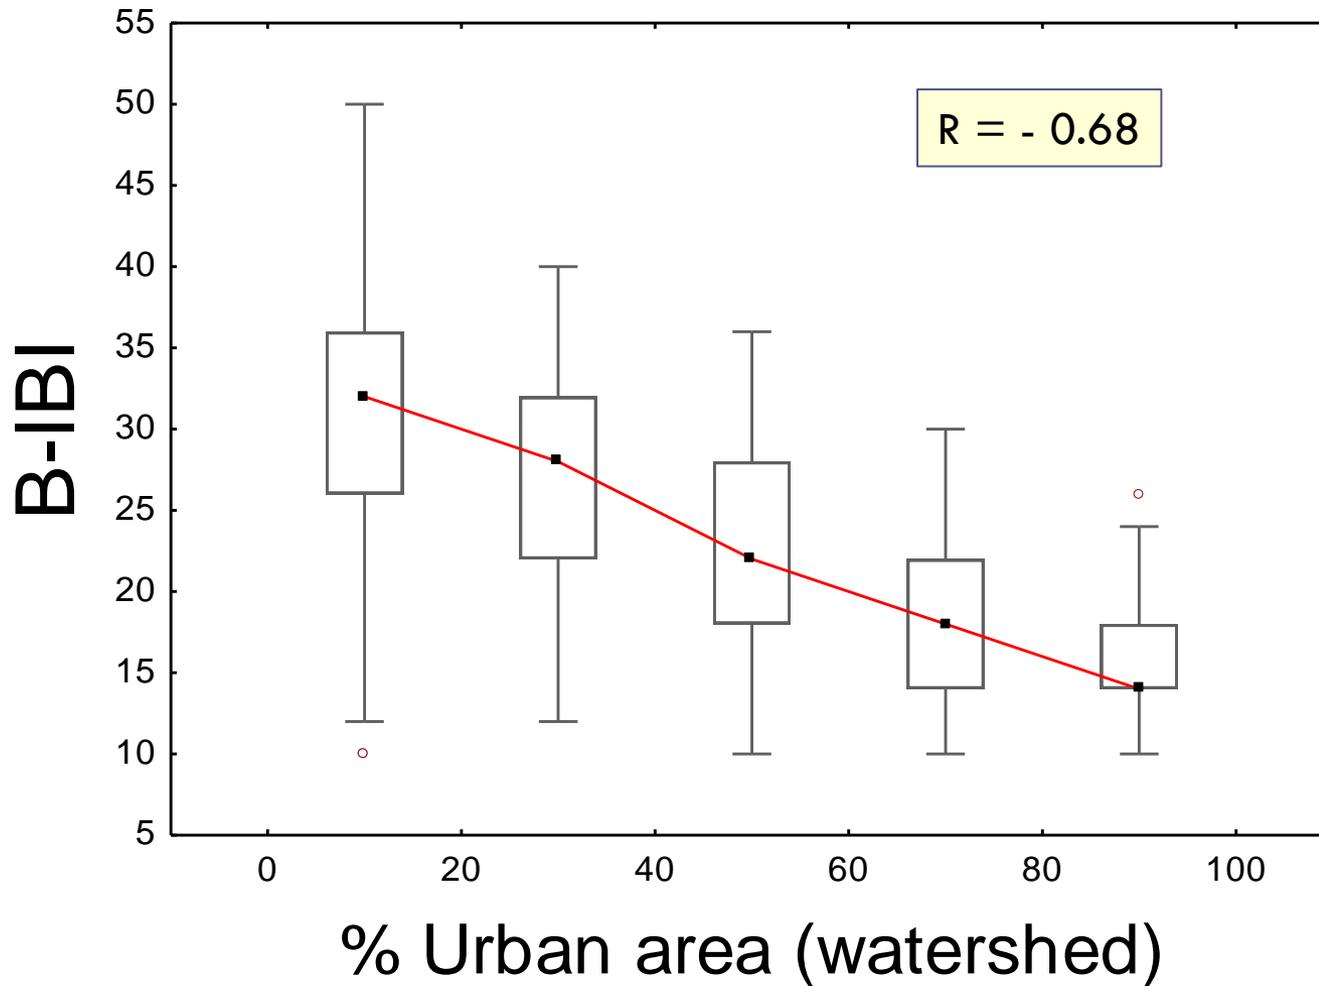

Watershed Delineation and Land Cover Calculations

- Peter Leinenbach (EPA)
- 1132+ locations
- Land cover & GIS metrics
- Measure disturbance
- Test/refine taxa attributes

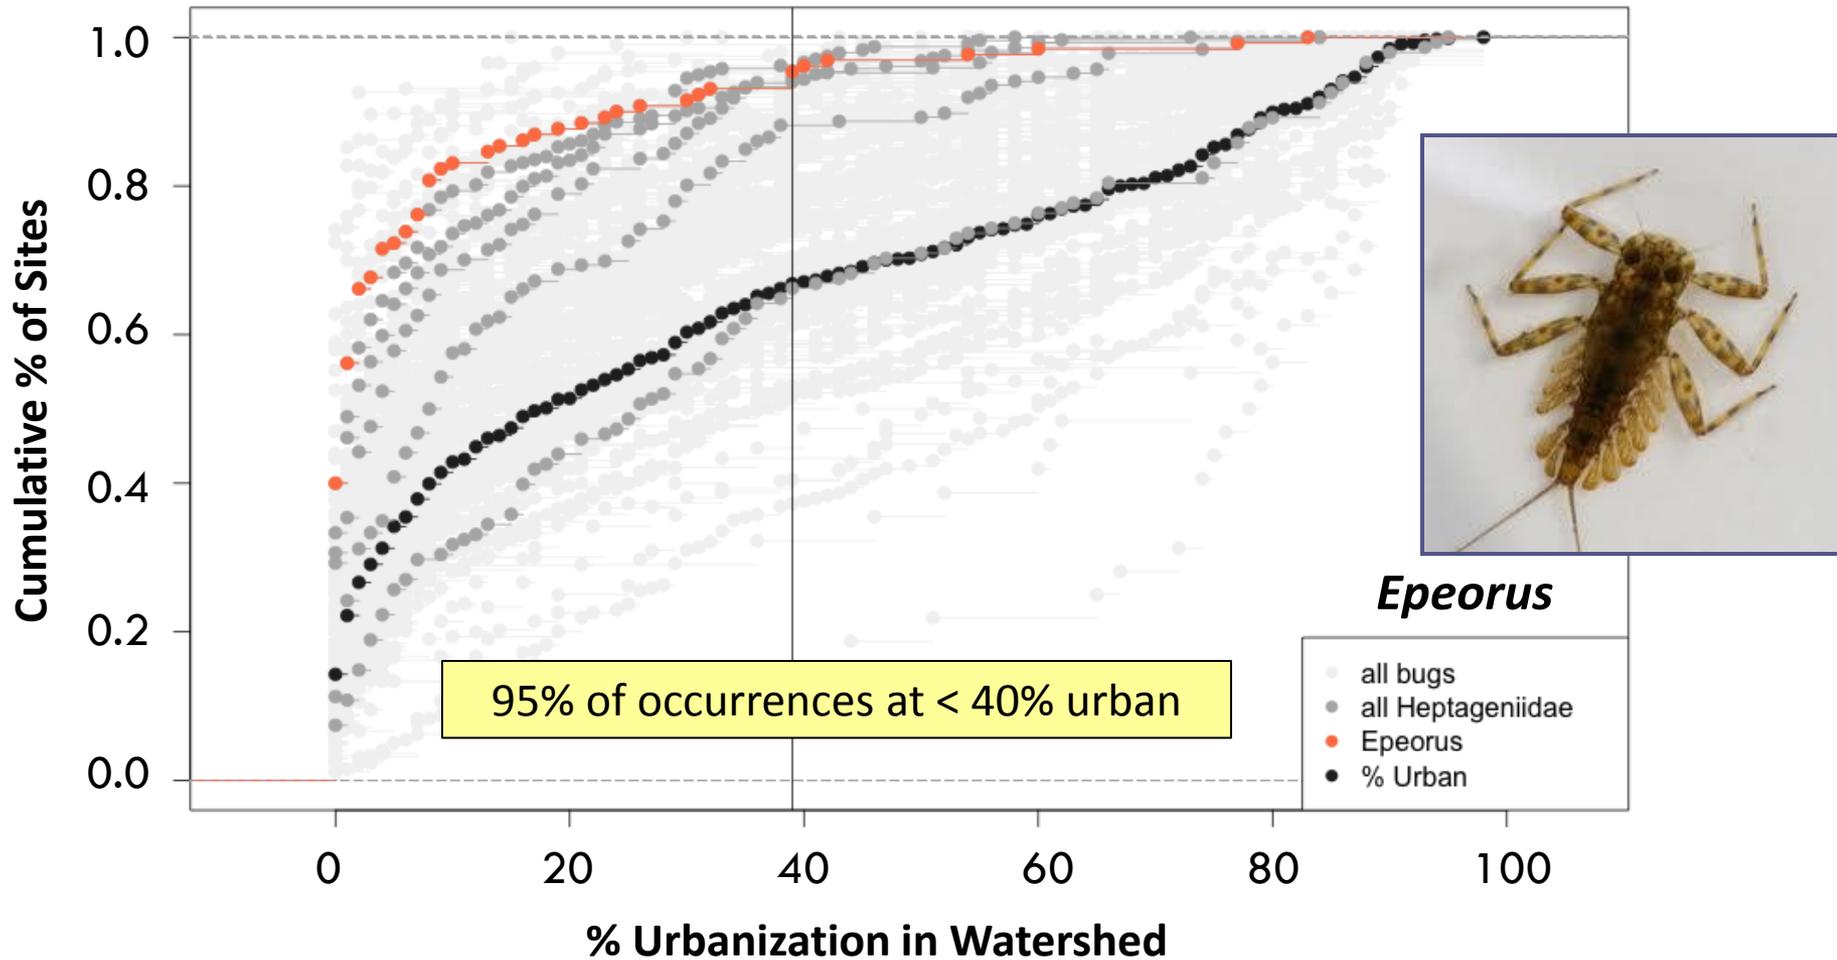

Shapefiles & metrics available on the PSSB!!!

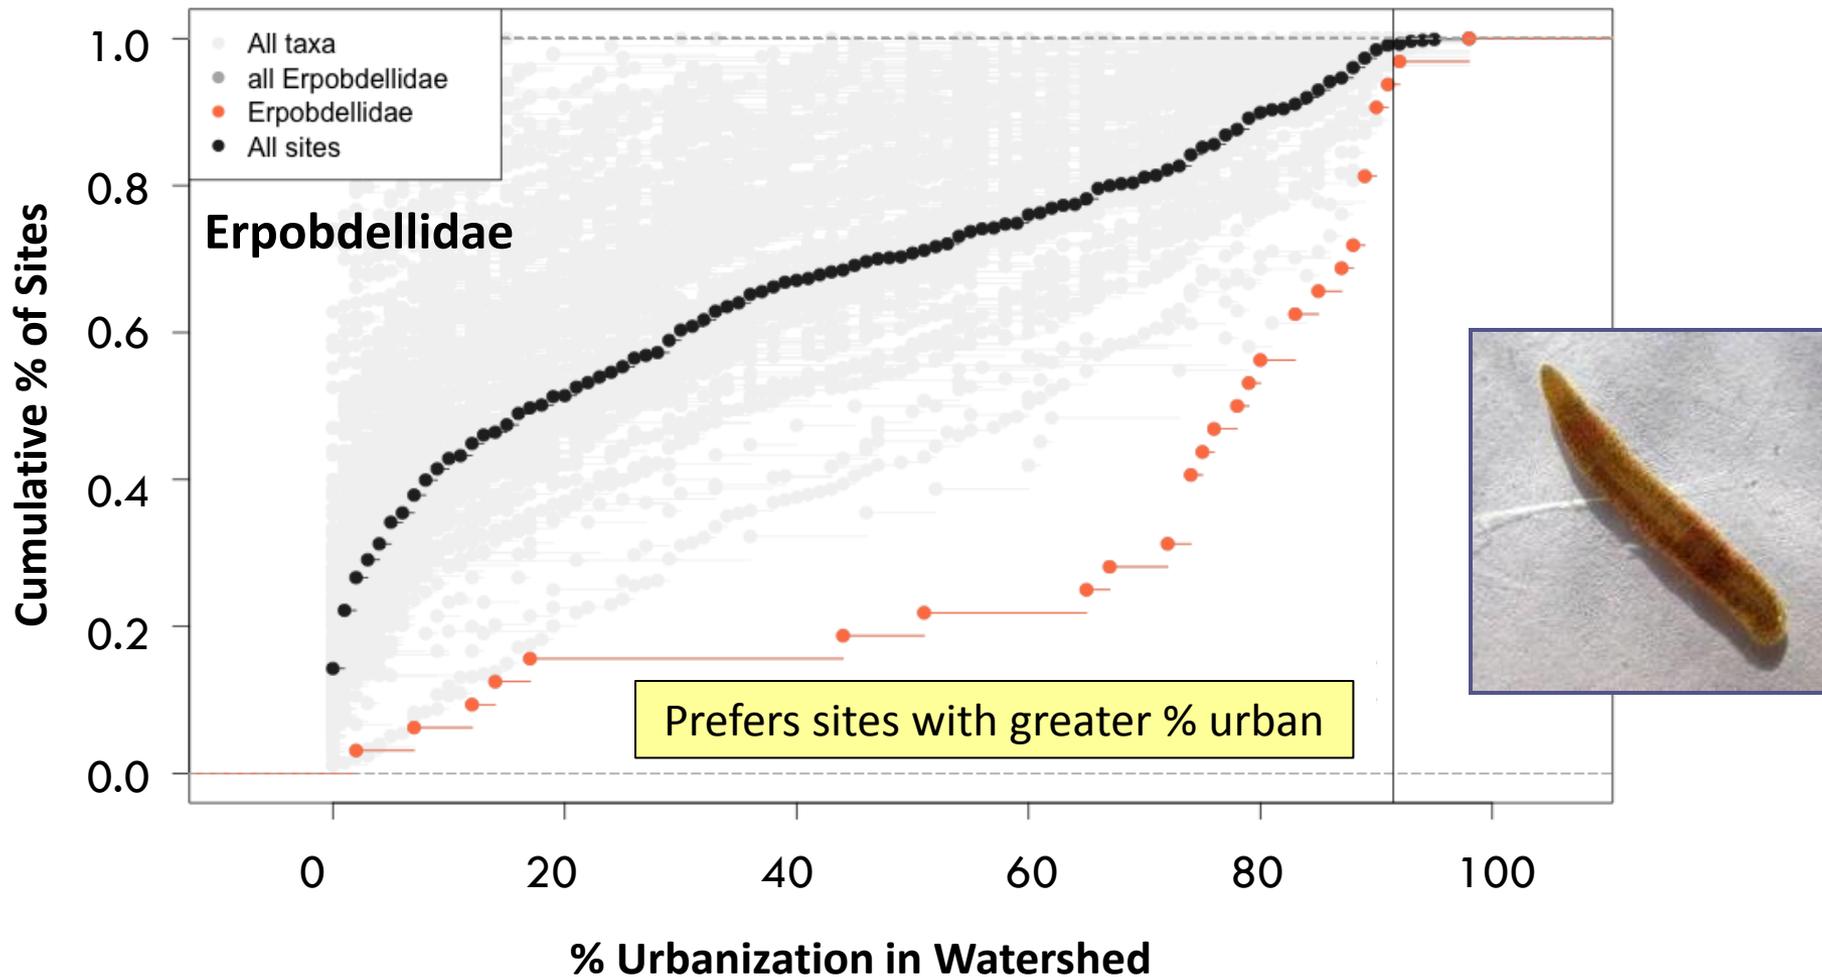

Strengthen Sensitivity of Tolerant/Intolerant Attributes

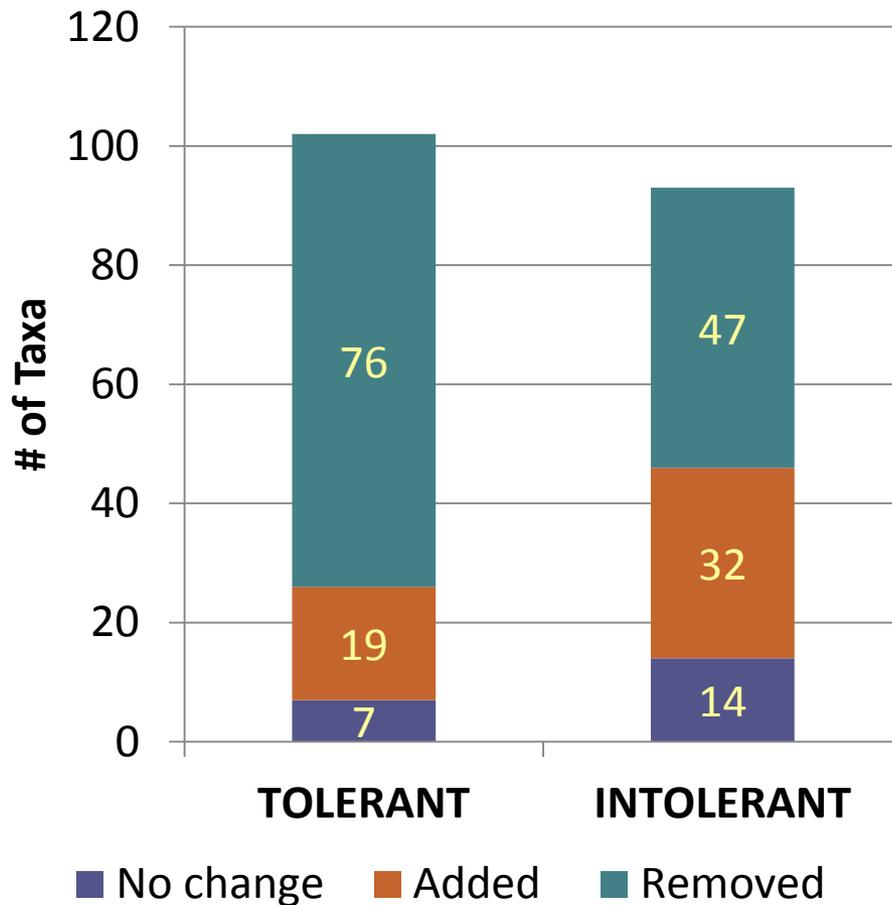

Example of an Intolerant Taxon

Example of a Tolerant Taxon

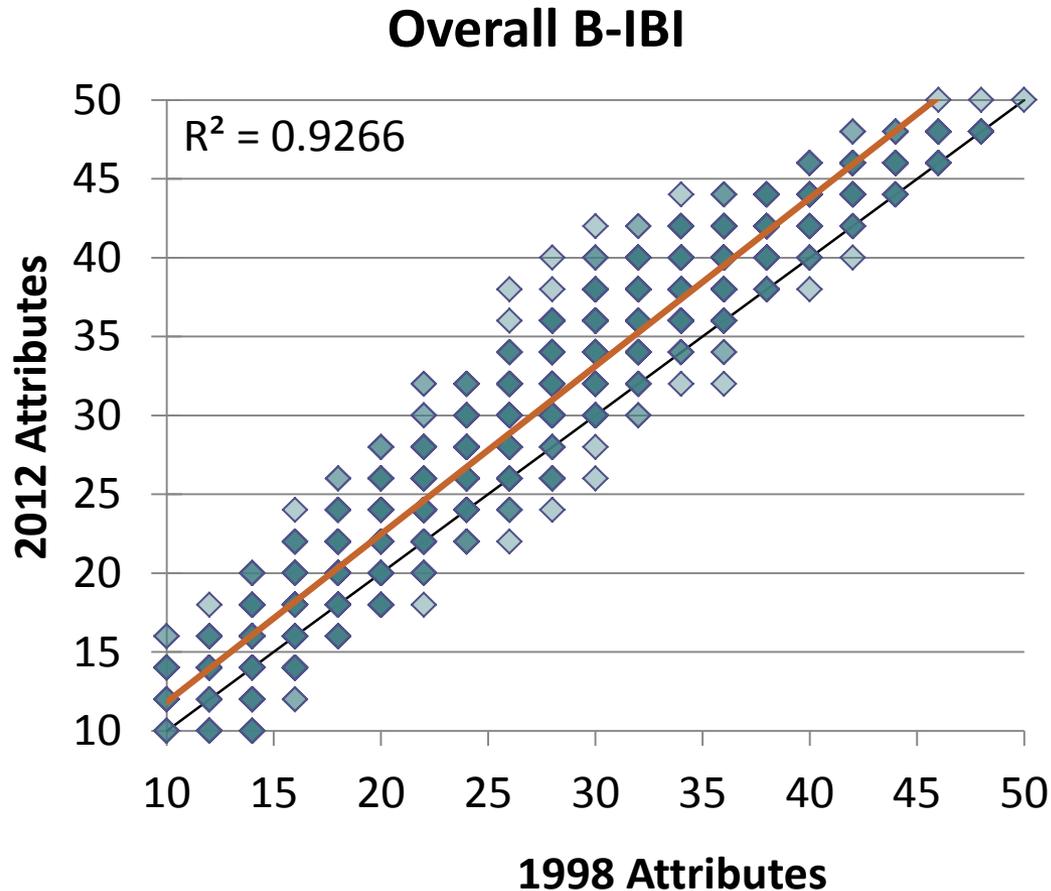

Attribute Changes: 1998 vs. 2012

Metric	Updated (2012)	Original (1998)
Tolerant	0.62	0.47
Intolerant	-0.75	-0.52

B-IBI Scores: Attributes Compared

Metric	R ²	Mean Residual*
Long-lived Taxa	0.41	3.2
Intolerant Taxa	0.49	1.35
Clinger Taxa	0.95	1.21
% Tolerant	0.07	-1.96%
% Predator	0.96	0.46%
Overall B-IBI	0.93	2.98

* All mean residuals significantly different than 0 ($p < 0.05$)

Taxa Attribute Conclusions

- ✈ No change to structure of B-IBI, all metrics highly correlated with % urbanization
- ✈ Many rare taxa dropped from tolerant and intolerant lists
- ✈ Taxa attribute updates require B-IBI recalibration

B-IBI Recalibration

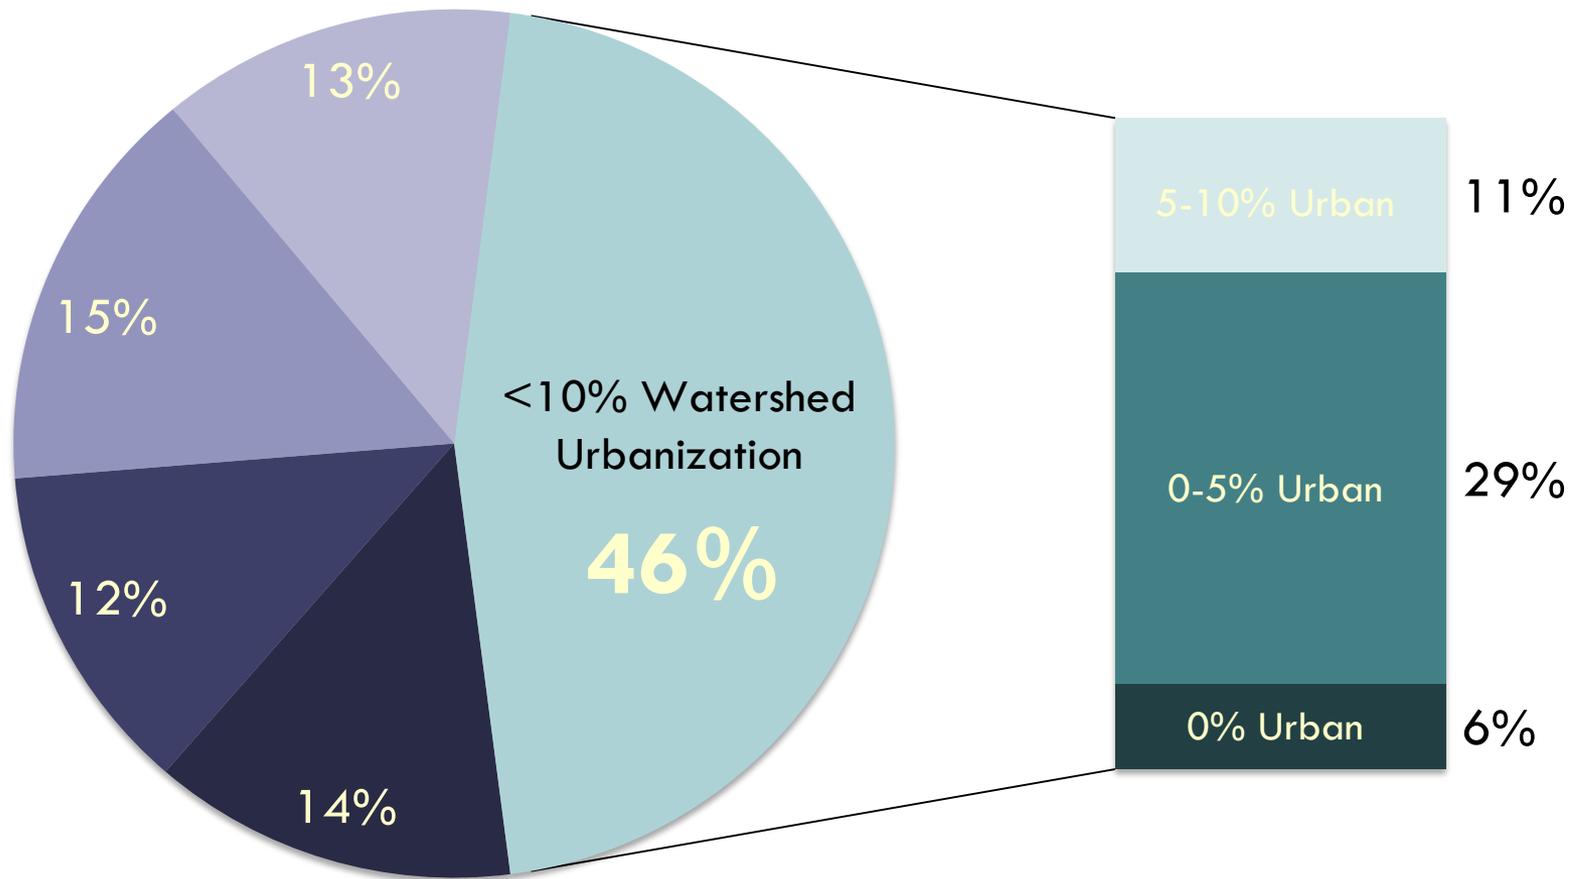

- Incorporate new attributes
- Utilize existing data: 856 sites
- New scoring scheme
- Apply any adjustments?

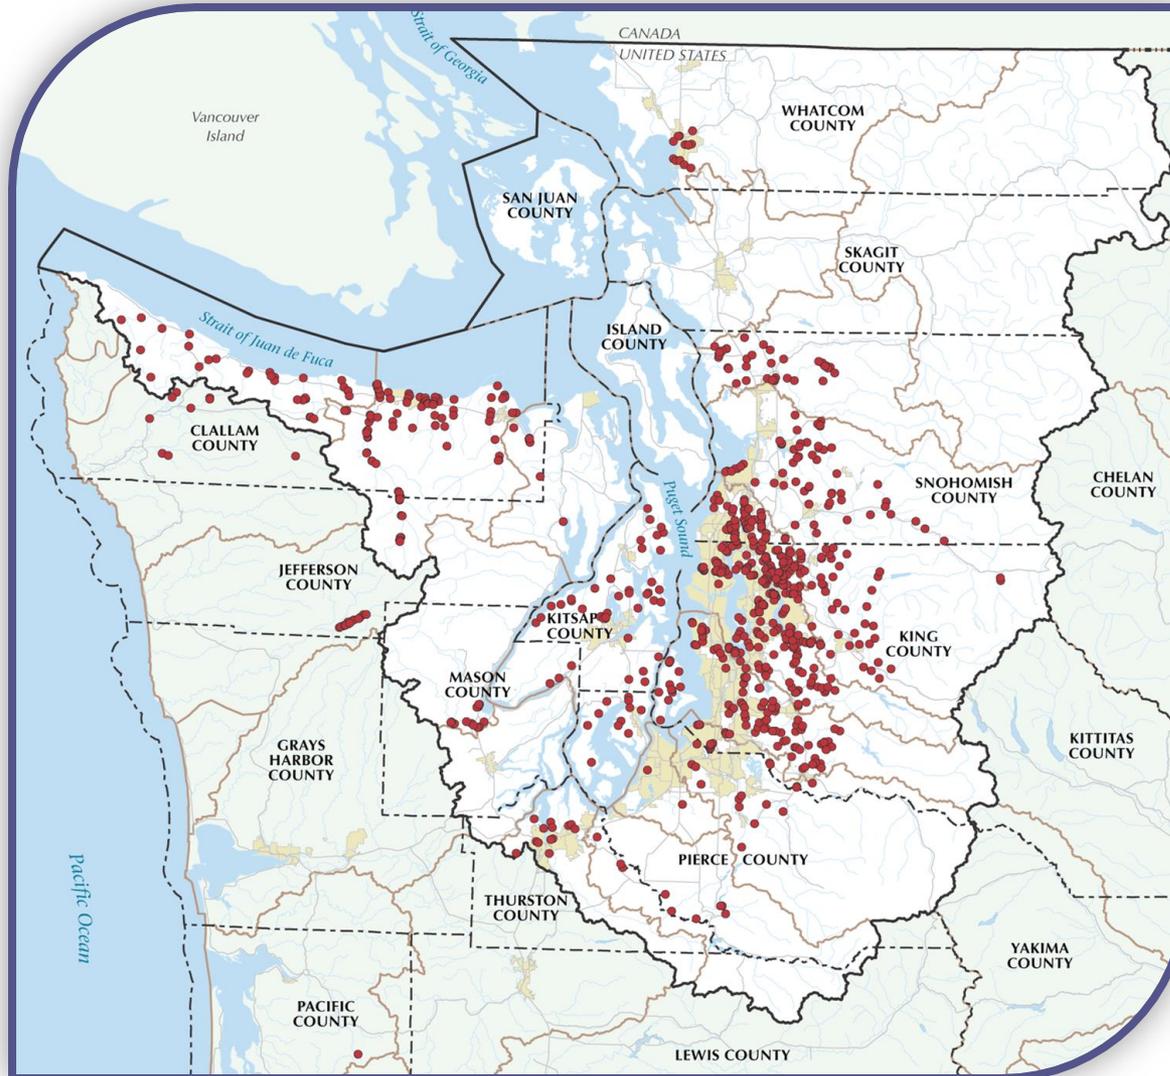

Landcover: Watershed Urbanization

% Watershed Urbanization

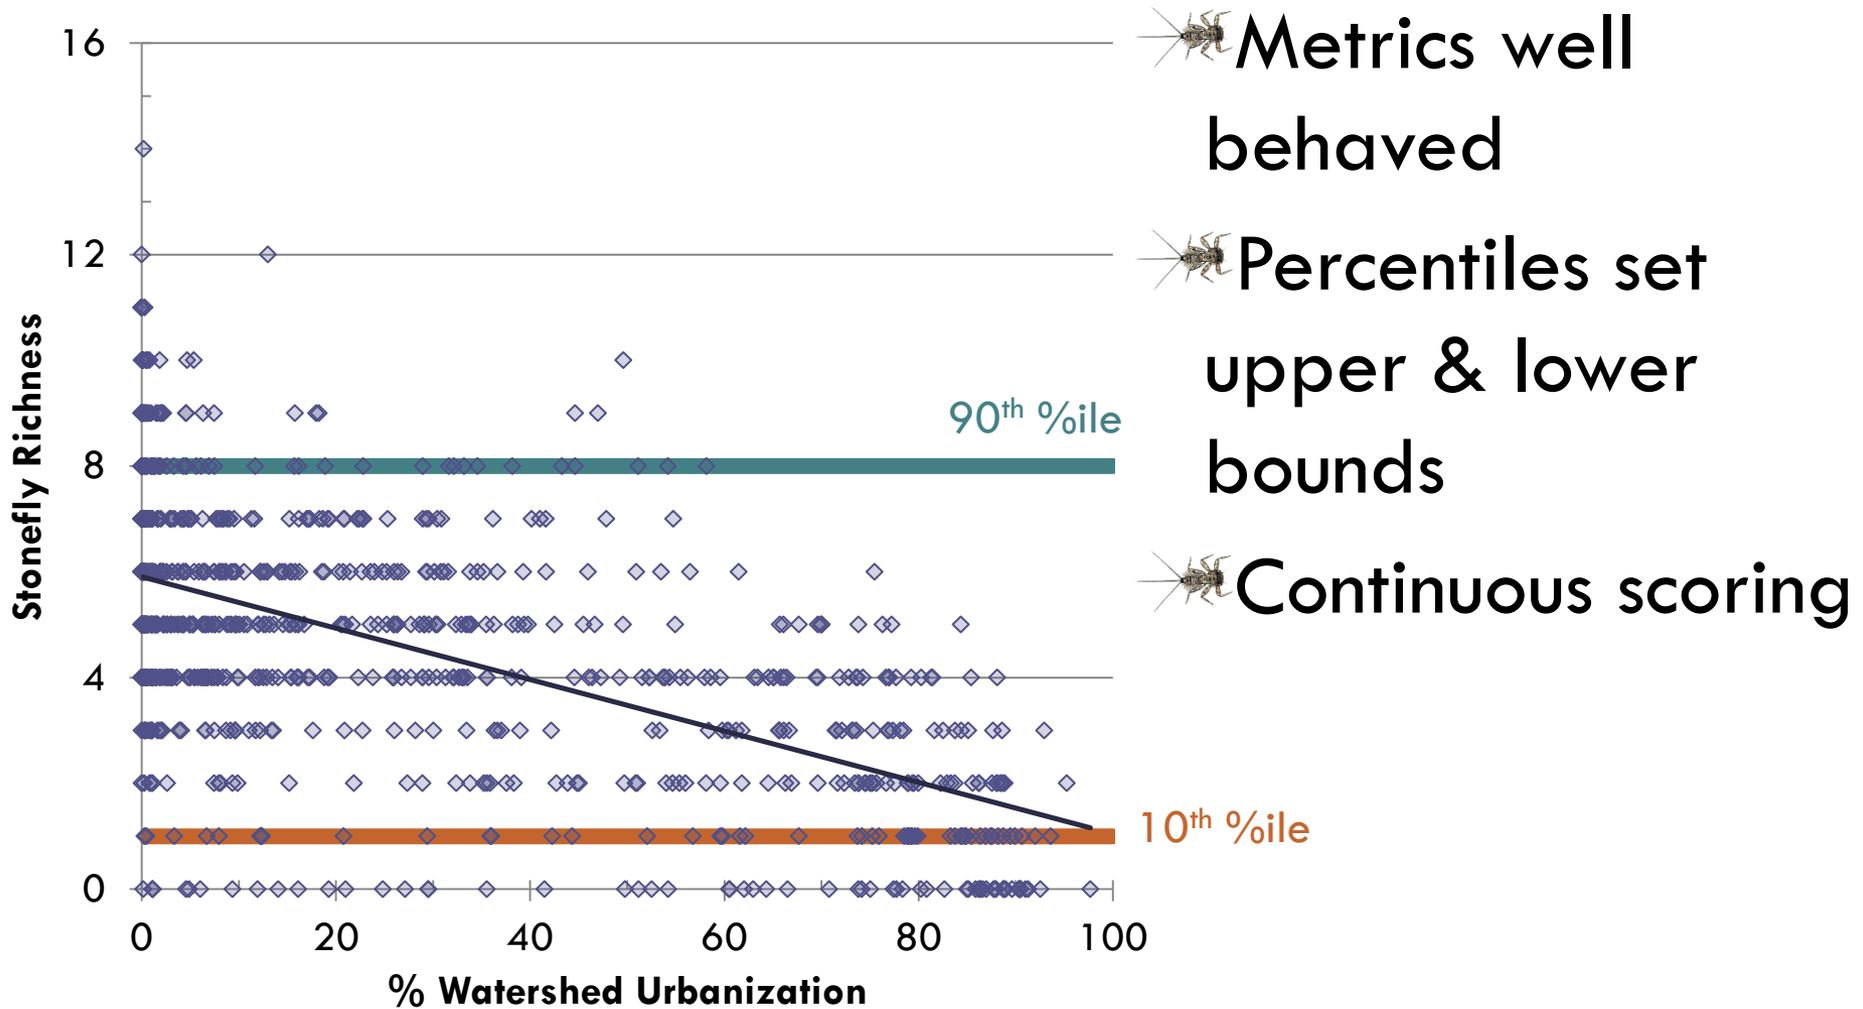

■ 75-100 ■ 50-75 ■ 25-50 ■ 10-25 ■ 5-10 ■ 0-5 ■ 0

B-IBI Recalibration: Scoring

B-IBI Recalibration: Scoring

$$= \frac{10 * (\text{Observed Value} - 10^{\text{th}} \text{ \%ile})}{(90^{\text{th}} \text{ \%ile} - 10^{\text{th}} \text{ \%ile})}$$

 Metrics that *decrease* with disturbance

 Values < 10th %ile score 0

 Values > 90th %ile score 10

B-IBI Recalibration: Scoring

$$= 10 - \left[\frac{10 * (\text{Observed Value} - 10^{\text{th}} \text{ \%ile})}{(90^{\text{th}} \text{ \%ile} - 10^{\text{th}} \text{ \%ile})} \right]$$

 Metrics that ~~decrease~~ *increase* with disturbance

 Values < 10th %ile score ~~0~~ 10

 Values > 90th %ile score ~~10~~ 0

B-IBI Recalibration: Testing

- Natural Factors (Elene's Talk)
- Collection Area (3 vs. 8 ft²)
- Taxonomic Effort

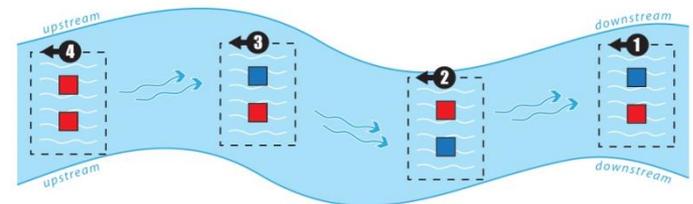

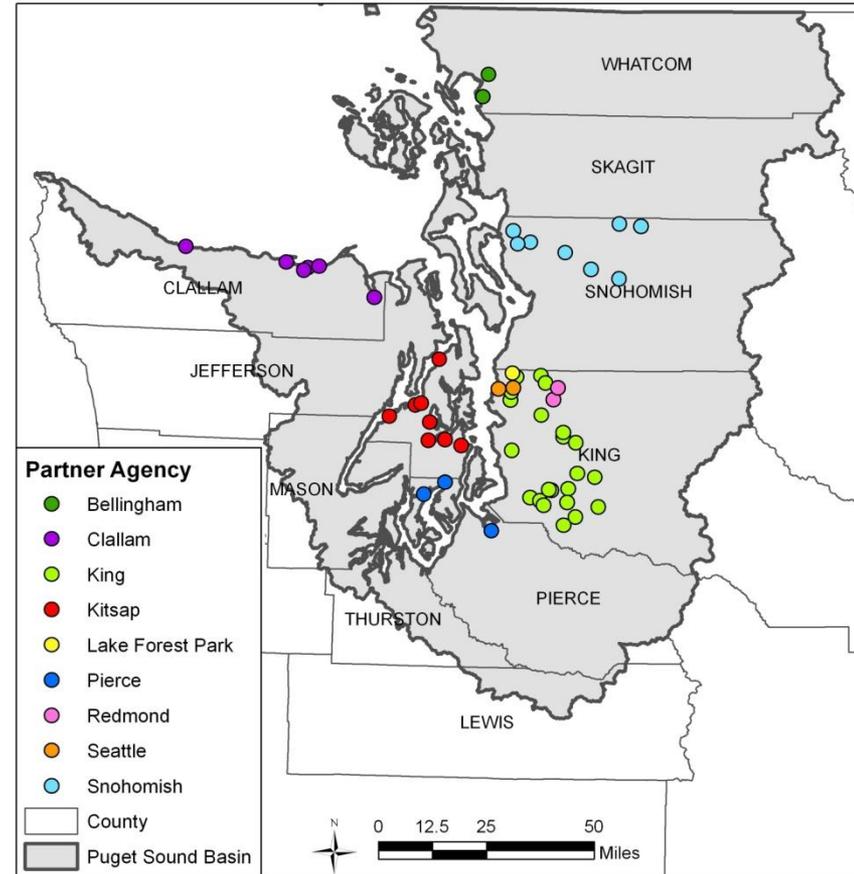

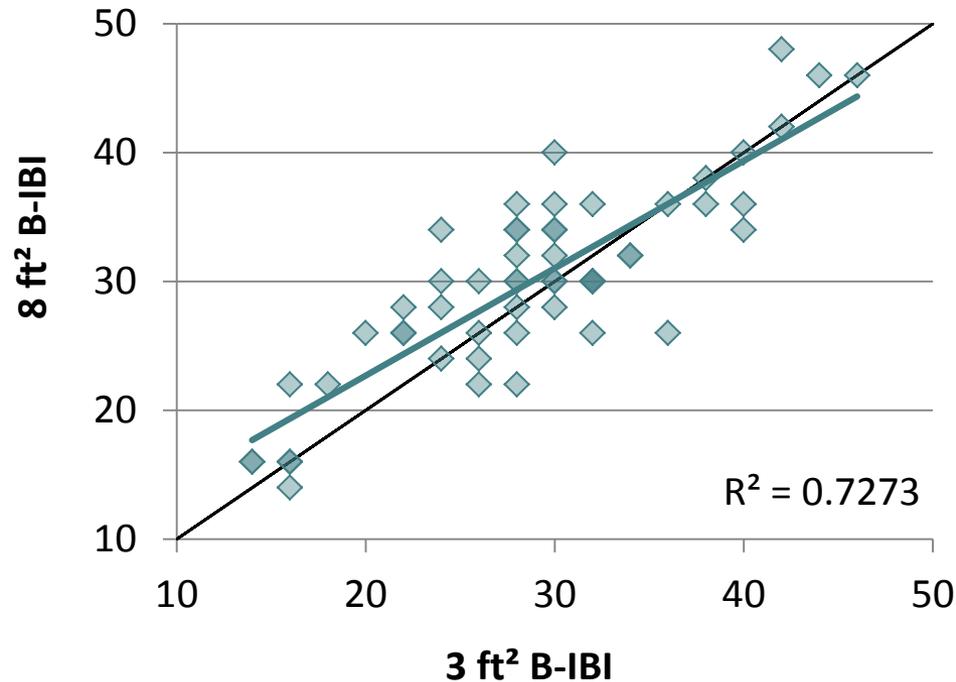

Side by Side Sampling (2011)

 3, 8, 9 sq ft

 55 sites

 9 partners

Collection Area

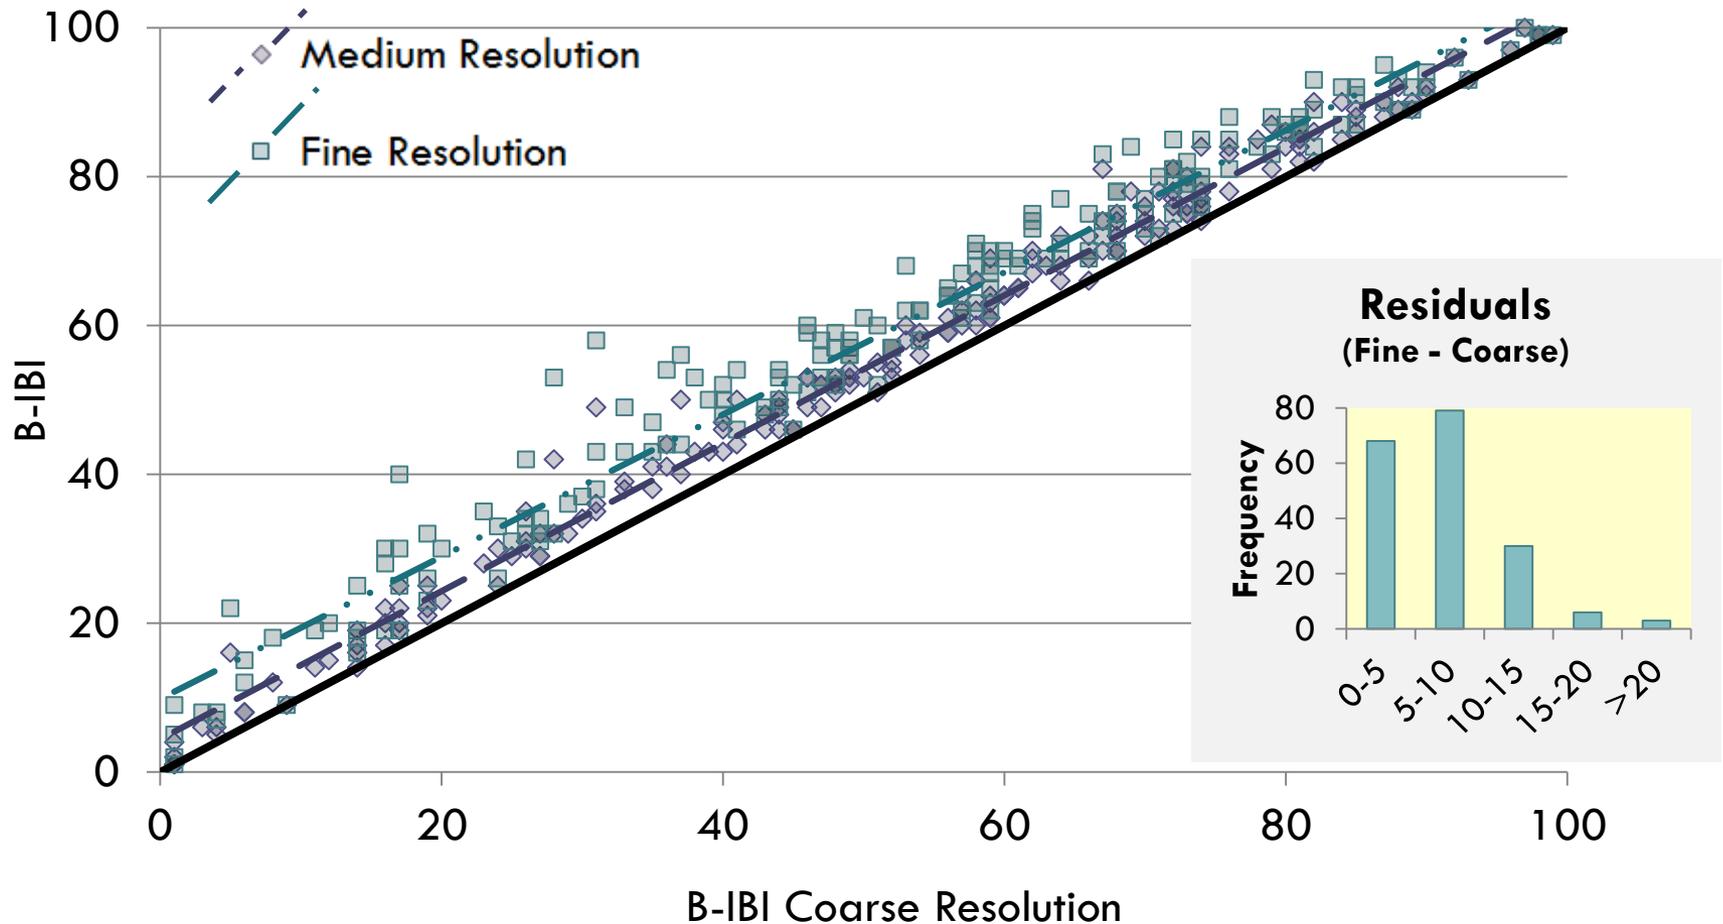

Taxa Effort: 3 Levels of Resolution

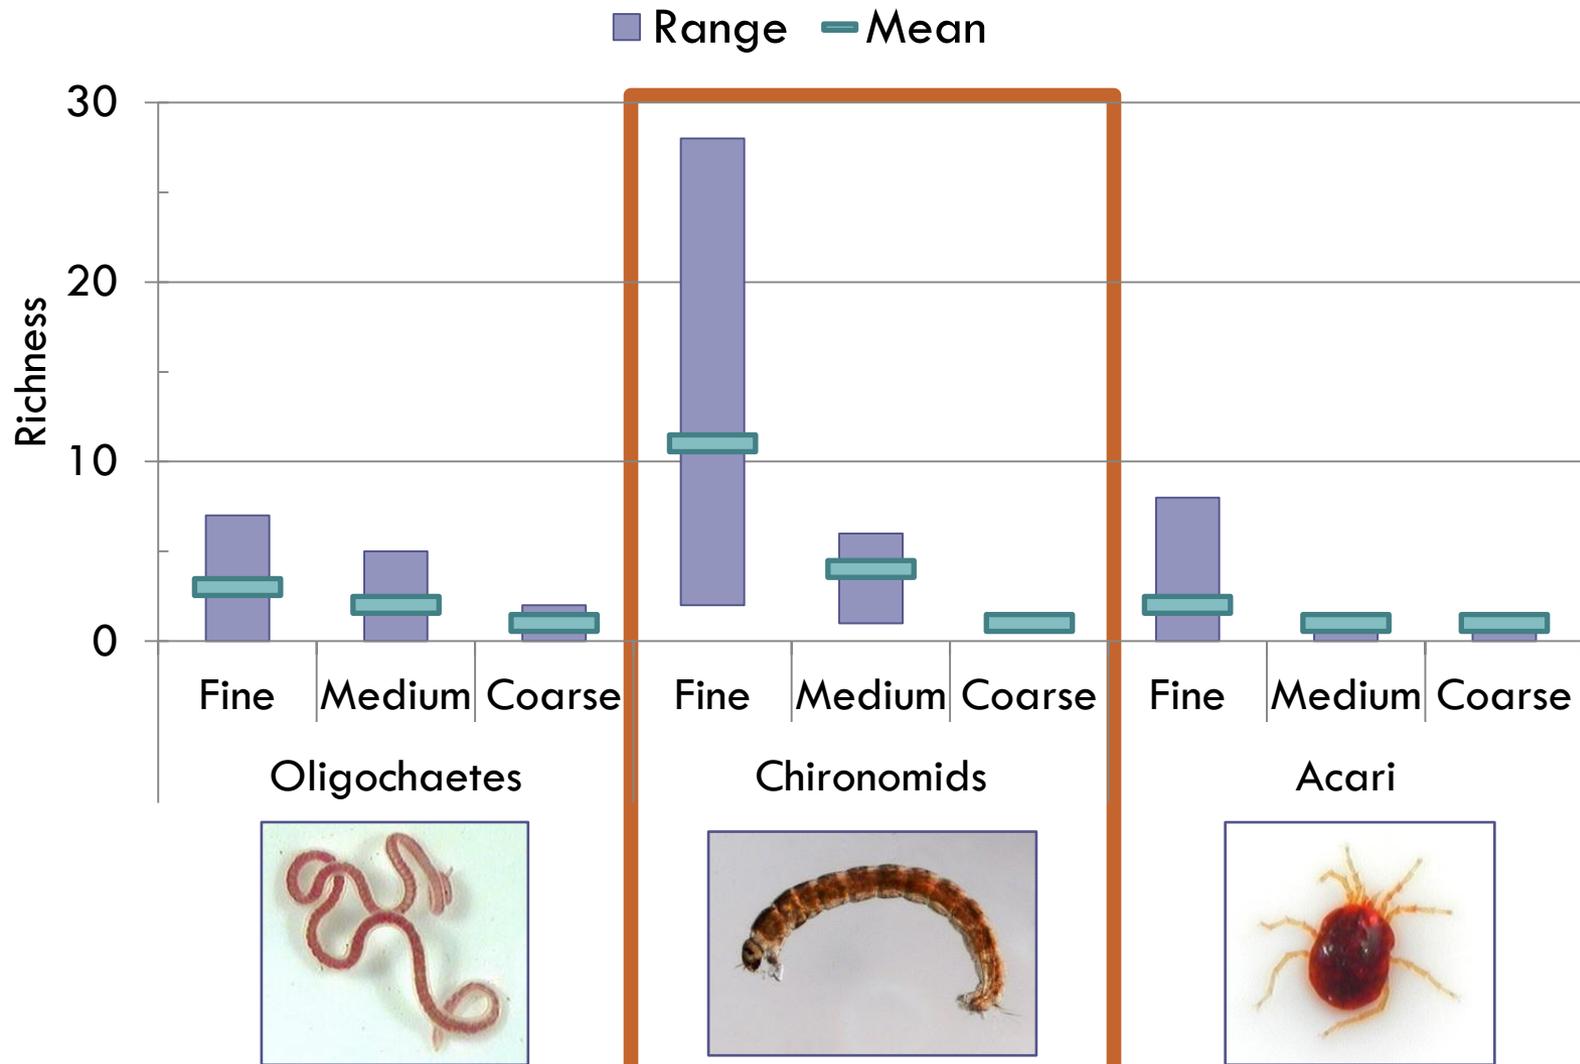

Taxa	Fine	Medium	Coarse
Oligochaetes	Subfamily/Genus	Family	Subclass
Acari	Genus	Subclass	Subclass
Gastropods	Genus	Genus	Family
Dytiscids	Genus	Genus (adults) Family (larvae)	Family
Simulids	Genus	Genus (larvae) Family (pupae)	Family
Chironomids	Genus/Sp/Sp grp	Subfamily/tribe	Family
Trichoptera (Pupae only)	Genus/Sp/Sp grp	Family	Order

 *Other groups = Lowest practical level (Genus/sp)*

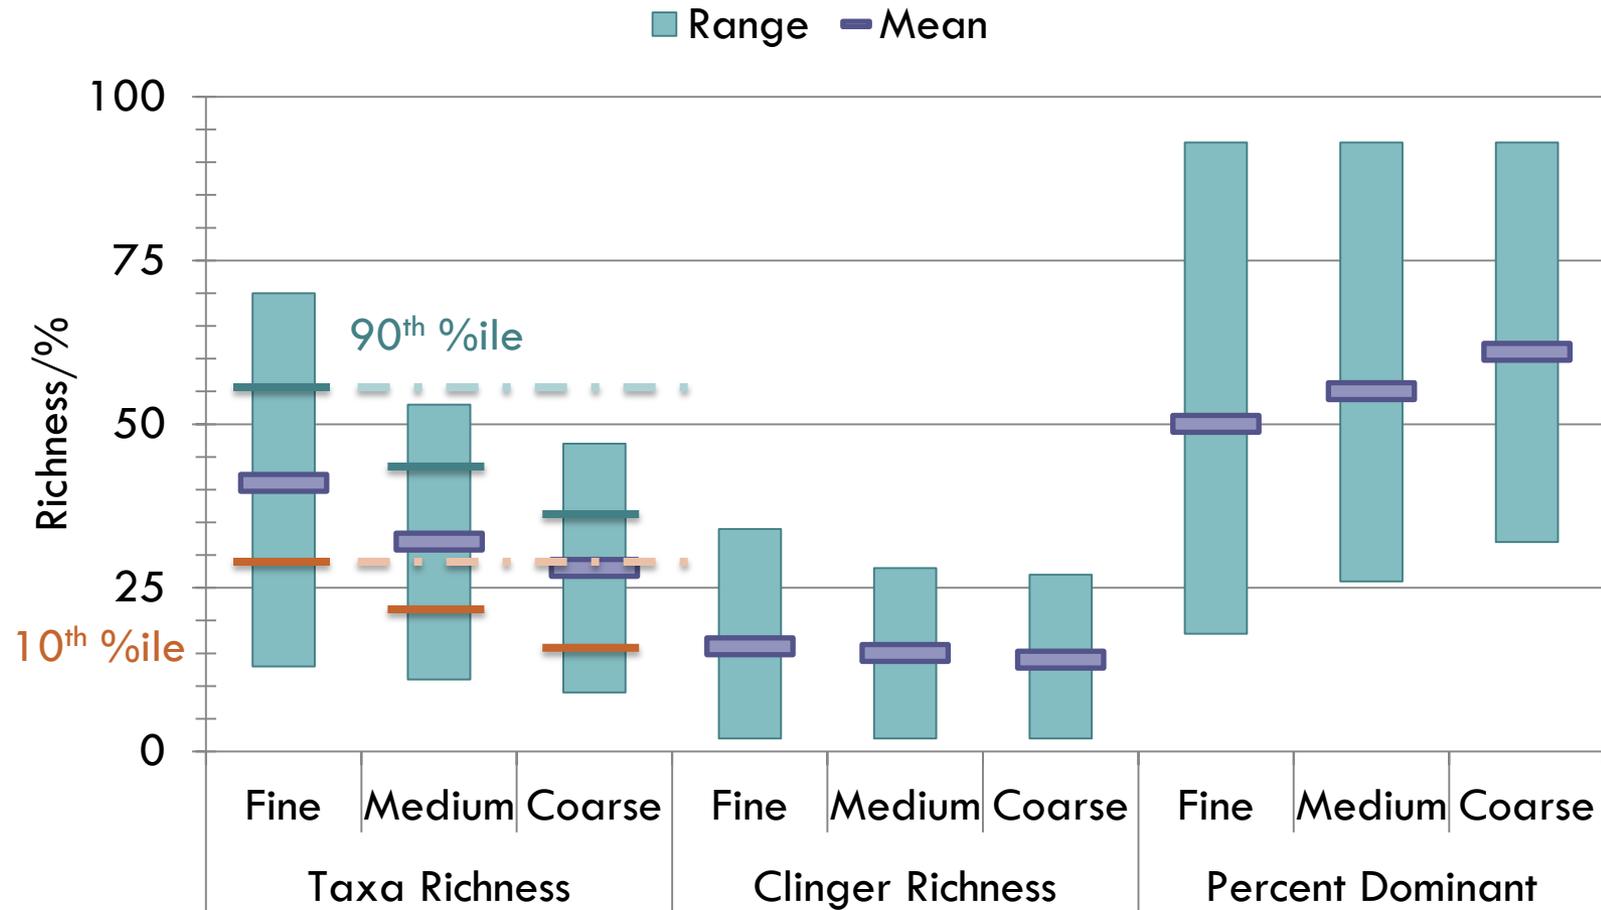

B-IBI: No Taxa Adjustments

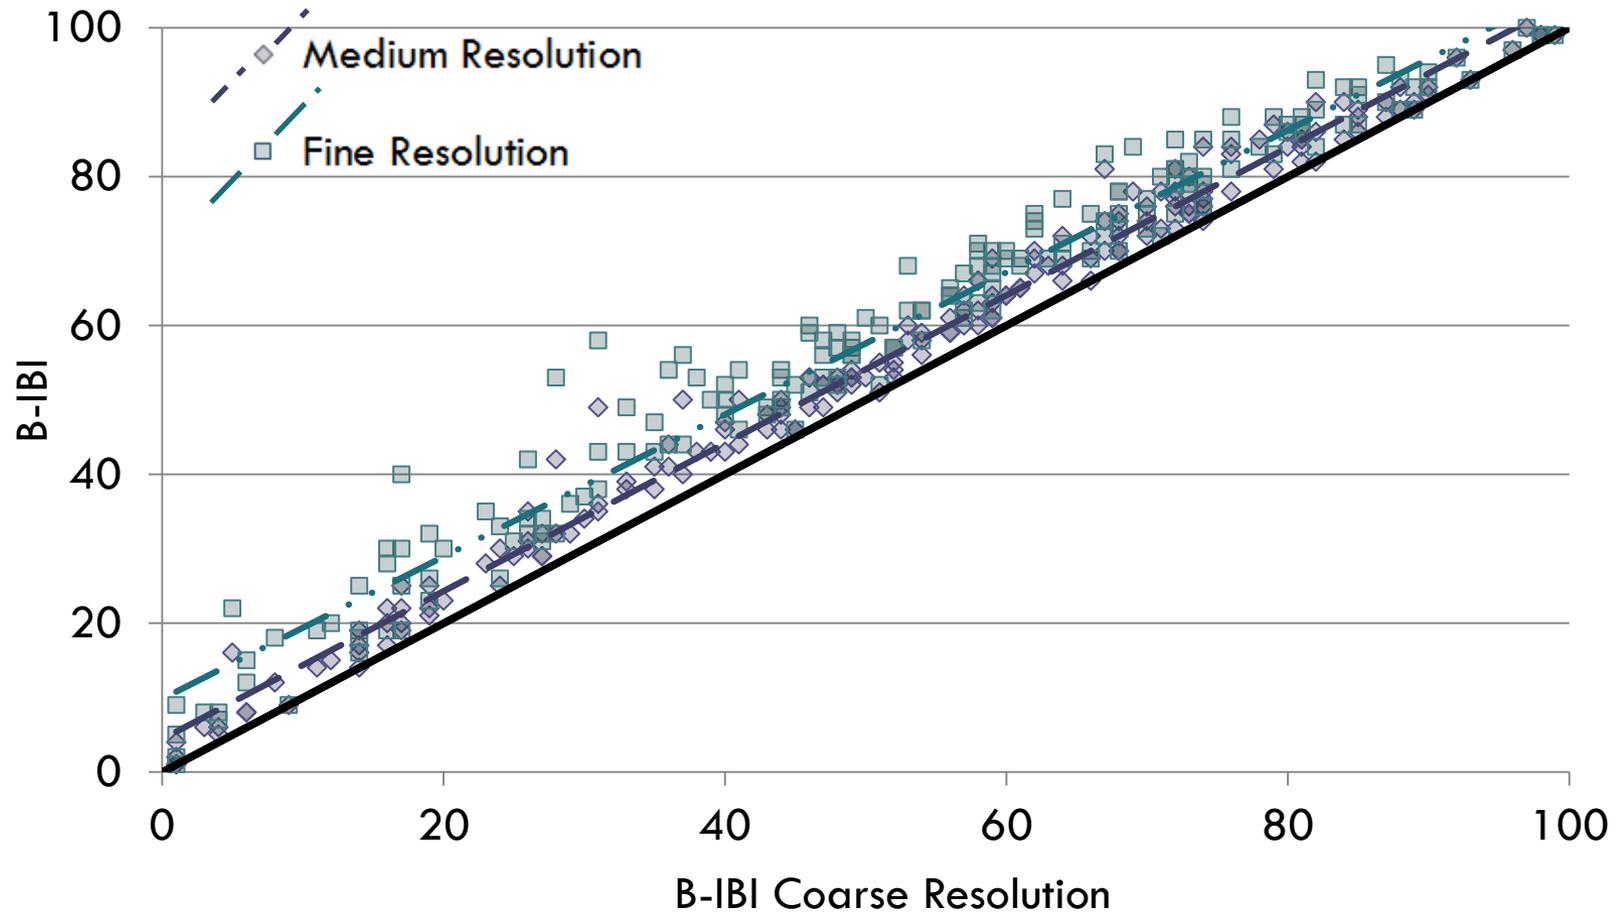

Taxa Effort: Chironomids Matter

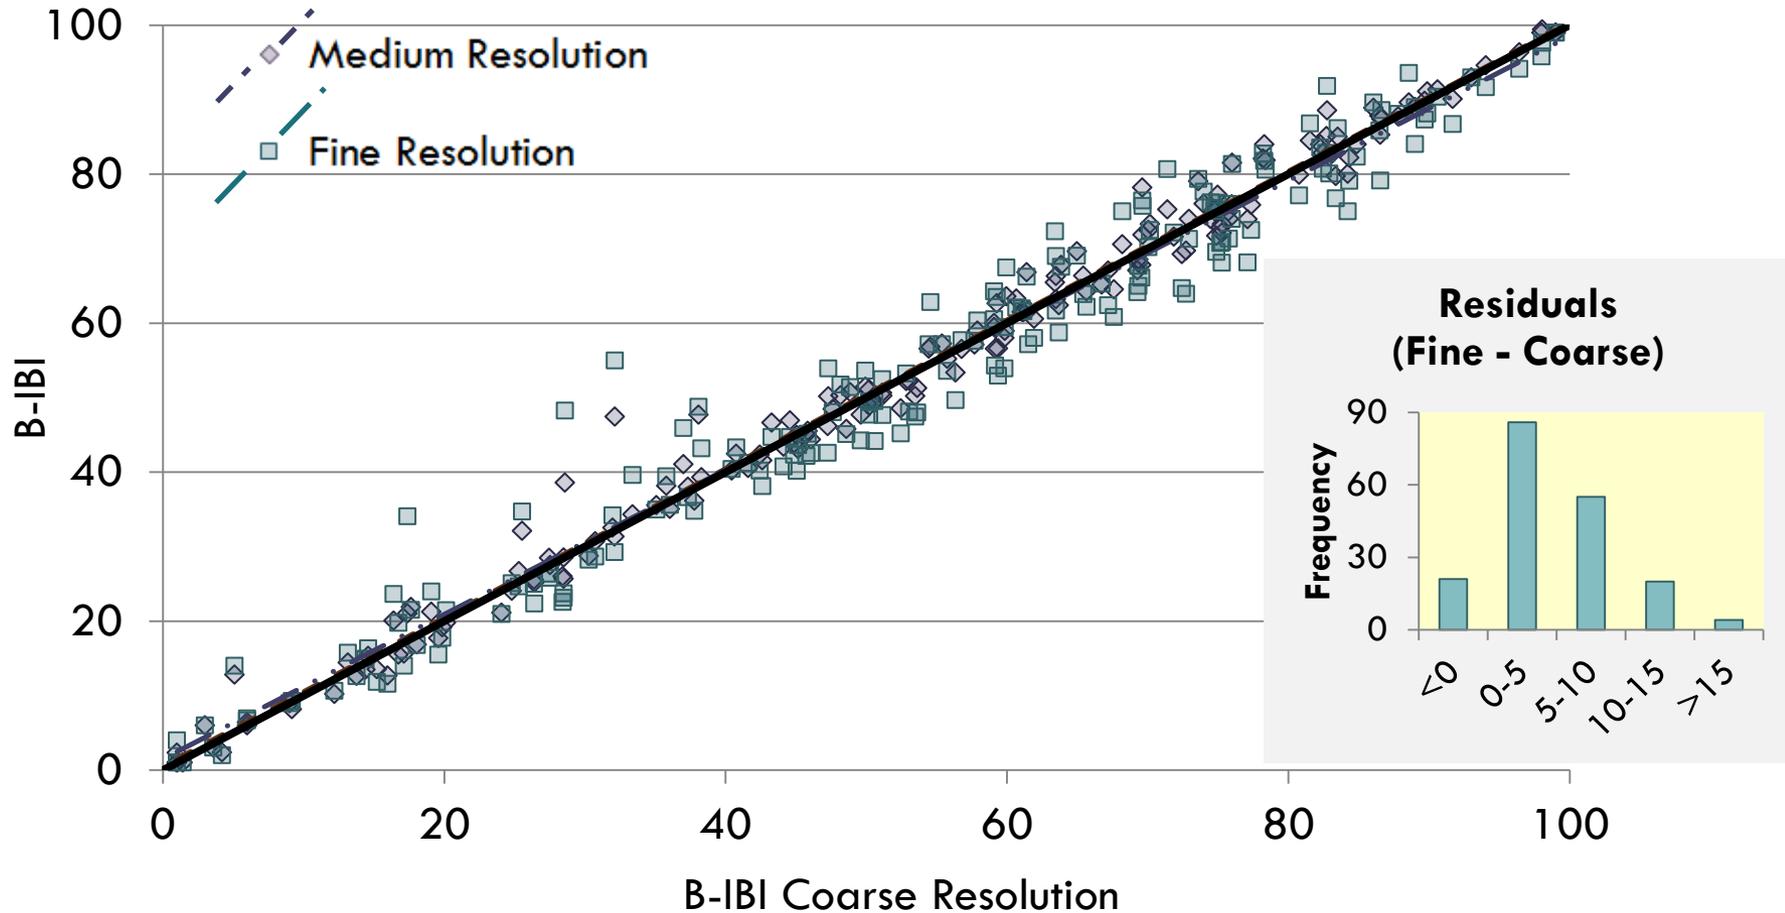

Taxa Effort: 3 Metrics Influenced

B-IBI: No Taxa Adjustments

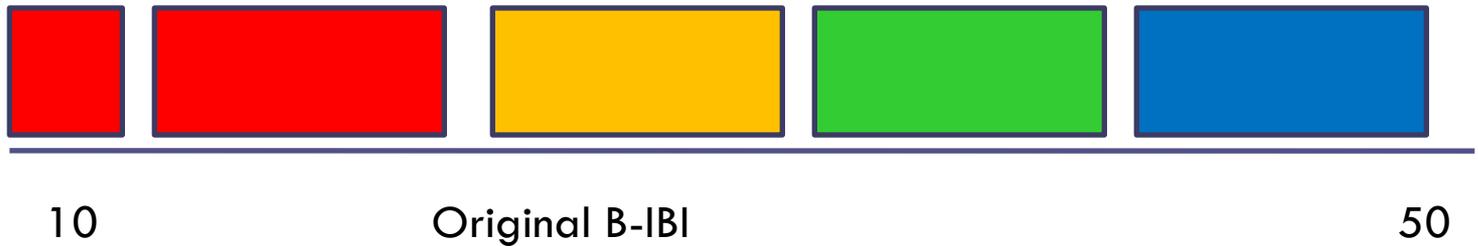

B-IBI: Adjusted for Taxa Effort

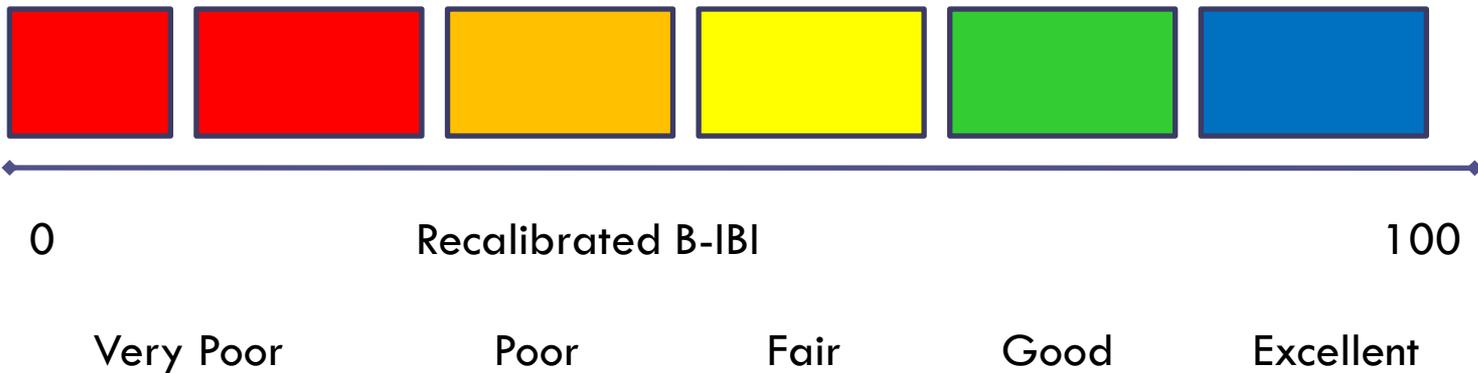

Precision of B-IBI: Comparison

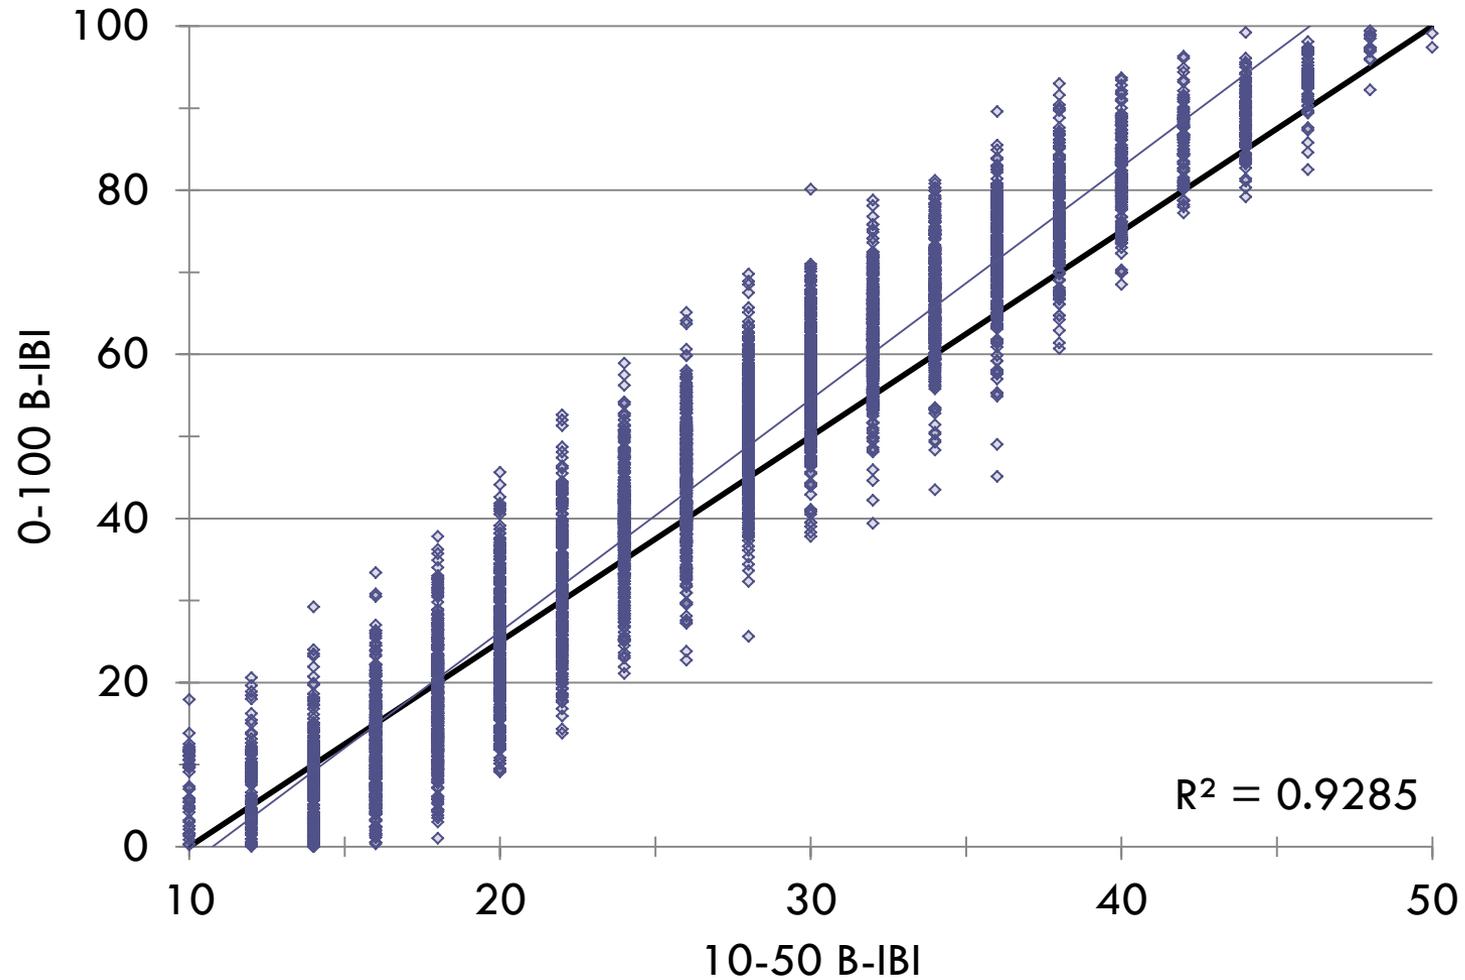

~ 4.3 categories of biological condition

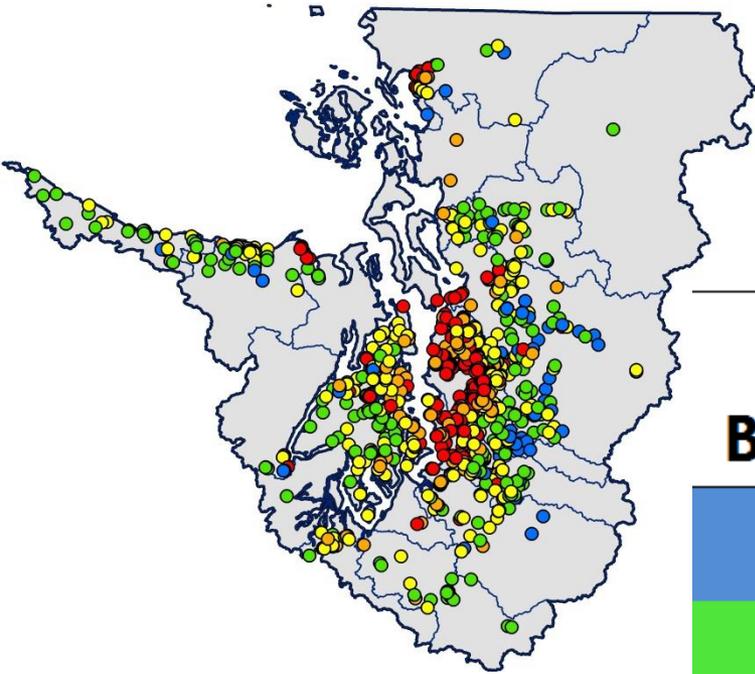

~ 5.6 categories of biological condition

B-IBI Recalibration: Comparison

B-IBI Condition Categories

Condition of Biotic Integrity	B-IBI ₁₀₋₅₀ Score	B-IBI ₀₋₁₀₀ Score
Excellent	46-50	80-100
Good	38-44	60-80
Fair	28-36	40-60
Poor	18-26	20-40
Very Poor	10-16	0-20

Fore, Wisseman, 2012 (recommended for 0-100 B-IBI)
Wisseman, 1998 (recommended for 10-50 B-IBI)

Specify the compilation of attributes or characteristics of the taxa included in the analysis. These attributes include whether or not the invertebrate is a predator, long-lived, and tolerant or intolerant of pollution, and whether or not the animal is a clinger.

Score Type |

0-100 B-IBI ▼
0-100 B-IBI
10-50 B-IBI
Ecology MMI
Metric Quantities without Scores

Select the score type. B-IBI is scored based on the designated taxonomic resolution.

B-IBI 0-100: Use the updated Puget Lowland B-IBI (2013). Individual metric scores range from 0-10, and the overall score (index) ranges from 0-100.

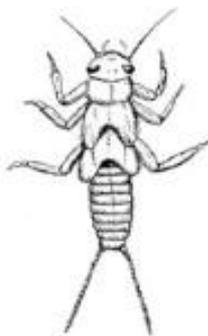

B-IBI 10-50: Use the historic Puget Lowland B-IBI (Species-Family and Species-Genus; developed in the 1990s). Individual metrics are scored 1, 3, or 5, and the overall score (index)

Analyzing Stream Health

This site analyzes benthic macro-invertebrate community structure to determine the ecological health of streams. [Participating agencies](#) use this site to manage, analyze and share data from their ongoing stream monitoring programs.

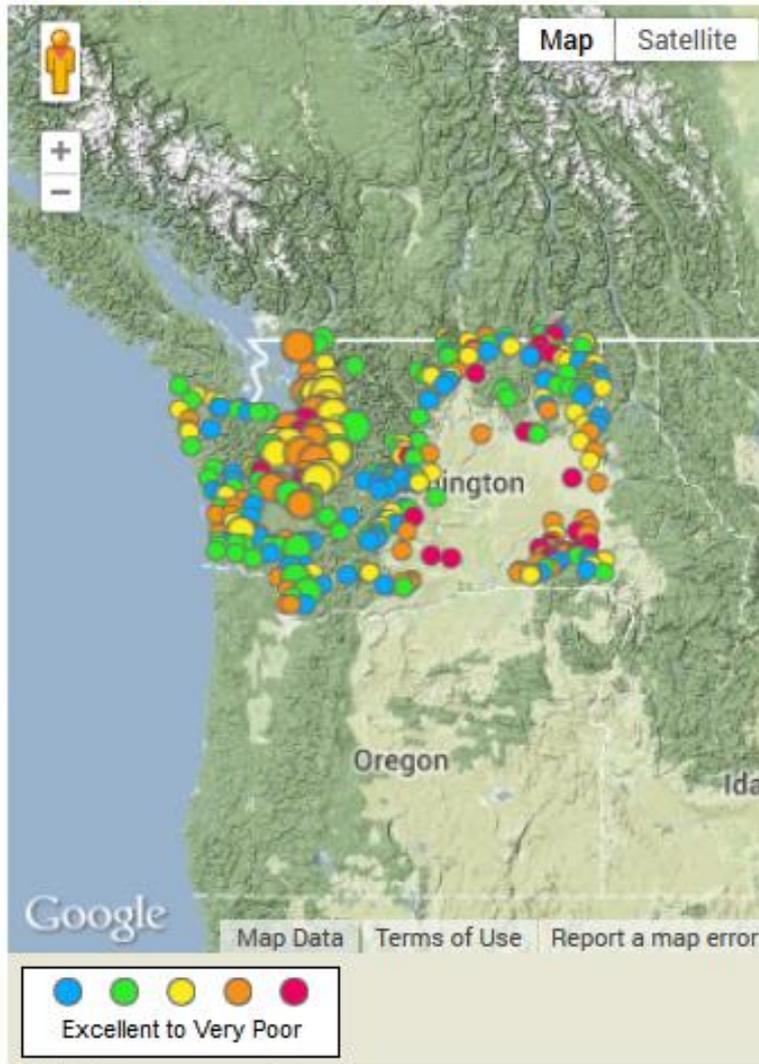

Benthic macro-invertebrates, also known as stream bugs, are animals that can be seen with the naked eye, do not have backbones and live in the **stream benthos**—in or near the streambed. They include insects, crustaceans,

worms, snails, clams, etc.

Benthic macroinvertebrates are monitored because they are good indicators of the biological health of stream systems and play a crucial role in the stream ecosystem.

Plotting Biotic Integrity

B-IBI Recalibration

Enhancement and Standardization of Benthic Macroinvertebrate Monitoring and Analysis Tools for the Puget Sound Region

Background

In 2010 King County was awarded [a grant from the EPA](#) to begin working towards a more standardized approach for benthic macroinvertebrate monitoring and data analysis in the Puget Sound region. Standardization begins with collaboration; this project brings together regional partners and experts to define standards for macroinvertebrate-based stream assessment.

Stream bioassessment protocols, including the multi-metric Puget Lowland benthic index of biotic integrity (PL-B-IBI), were initially developed in the early 1990's and are widely used to report stream health by over 20 cities, counties, tribes and state agencies in the Puget Sound basin. However, despite widespread collection and use of macroinvertebrate data, a variety of factors made it difficult to compare and evaluate these data on a regional scale.

Many entities used different sampling and analysis methods making data comparison challenging. The taxa attributes used to calculate individual B-IBI metrics were out of date and not empirically derived. The original PL-B-IBI was derived from a spatially limited data set raising concern regarding its regional applicability. Taxonomic resolution used by different entities is variable throughout the region. The Puget Sound Stream Benthos (PSSB) data system was established in 2008 as a regional tool for macroinvertebrate data management; however, there was a need to enhance the functionality of the system and increase regional participation. These issues, in addition to an overarching need for regional collaboration to encourage a more standardized and regional approach to monitoring and data analysis and a desire to strengthen and enhance the B-IBI as a regional freshwater indicator led to the development of this project.

Primary Project Goals

- Strengthen the B-IBI sensitivity by updating the taxa attributes used to calculate the % predator individuals, clinger taxa richness, long-lived taxa richness, % tolerant individuals and intolerant taxa richness metrics
- Evaluate differences in sampling methods to allow for regional comparison of data
- Recalibrate the Puget Lowland B-IBI using the wealth of existing data in the PSSB to enhance metric sensitivity
- Enhance the functionality and analytical capability of the PSSB
- Enhance and strengthen the sensitivity of the B-IBI for use as a regional freshwater indicator
- Enhance regional collaboration among jurisdictions and agencies that collect and use macroinvertebrate data

The background of the slide is a close-up photograph of stream benthos. In the foreground, several dark, segmented aquatic insects, likely caddisfly larvae, are crawling on a light-colored, textured rock surface. The background is filled with more rocks and water, creating a natural stream environment.
